

## **Executive Summary**

This analysis was conducted to understand the investment preferences and behavior of individuals in order to provide actionable insights for WealthBridge Advisors. The dataset consisted of 40 survey respondents with information on demographics, investment preferences, decision-making factors, savings objectives, expected returns, and sources of investment information.

The analysis revealed that the majority of respondents were male (62.5%), while females accounted for 37.5% of the sample. The average age of investors was 27.8 years. Across both genders and all age groups, Public Provident Fund (PPF) and Mutual Funds emerged as the most preferred investment avenues, while Gold and Debentures were the least preferred. Investors generally favored long-term investment options with relatively lower risk.

Expected returns were the strongest factor influencing investment decisions across all age groups, followed by risk, while the locking period had the least influence. Investors with a 3–5 year investment horizon mainly saved for retirement planning. Respondents expecting returns between 20% and 30% preferred mutual funds primarily because of better returns, with fund diversification serving as a secondary motivation. Financial Consultants were identified as the most trusted source of investment information.

## **Recommendations**

1. WealthBridge Advisors should prioritize promoting long-term investment products such as PPF and Mutual Funds, as they align closely with investor preferences.
2. The firm should strengthen personalized financial advisory services, educational programs, and tailored investment recommendations since investors rely heavily on financial consultants when making investment decisions.

Overall, the findings provide valuable insights into investor behavior and can help WealthBridge Advisors design targeted investment strategies, improve customer engagement, and expand its client base.
